Fundamentals of Programming

Interlude:
Python, Sockets, and the Web

Adam Hartz
hz@mit.edu

CAT-SOOP

An “automatic tutor”: collect and assess online exercises
Written in Python, 2011-now, rewritten completely multiple times

Based on a program called “the tutor” by
Tomás Lozano-Pérez (written in Scheme!)

CAT-SOOP is a fairly standard web application. What does it do?

- Receive request from user
(“show me a page,” “submit this answer,” etc)
- Find relevant information
(page content, user info, history of submissions, etc)
- Log new information if necessary, and
- Send response
(typically, HTML to be displayed in the browser)

The World Wide Web

```

36 '255' white and vice versa). For example, here is a photograph of Adam H's cat. On
37 the left side is the original image, and on the right is an inverted version.
38
39 <center>
40 !<Stranger_the_cat!> (CURRENT/stronger.jpg)
41 </center>
42
43
44 Most of the implementation of the inversion filter has been completed for you
45 (it is invoked by calling the method called 'inverted'), but some pieces have
46 not been implemented correctly. Your task in this part of the lab is to fix
47 the implementation of the Inversion Filter.
48
49 Before you do that, however, let's add a simple test case so that we can test
50 whether our code is working.
51
52 Let's start with a 1x4 image that is defined with the following parameters:
53
54 <python>
55 tutor.init_random()
56 img1_lo = cs.random.randint(0, 32)
57 img1_mid = cs.random.randint(64, 96)
58 img1_mid2 = cs.random.randint(128, 160)
59 img1_high = cs.random.randint(192, 224)
60 img1_pixels = [img1_lo, img1_mid, img1_mid2, img1_high]
61 </python>
62
63 • height: '1'
64 • width: '4'
65 • pixels: '9(img1_pixels)'
66
67
68 <question python:literal>
69 <code><prompt>
70 If we were to run this image through a working inversion filter, what would the
71 expected output be? In the box below, enter a Python list representing the
72 expected 'pixels' key in the resulting image.</code>
73 '''
74
75 cs.solve = [255-1 for i in img1_pixels]
76 def cs.check_function(sub, sol):
77     if not(isinstance(sub, list)):
78         return (0.0, 'Please enter a Python list.')
79     if len(sub) != len(sol):
80         return (0.0, 'Double-check the length of the list you provided.')
81     elif not all(type(i)==type(j) and i==j for i,j in zip(sub, sol)):
82         return (0.0, 'Make sure that all of the elements in the given list are integers.')
83     return 1.0
84 </question>
85
86 <subsection>Adding a Test Case</subsection>
87
88 Let's also add this test case to the lab's regular tests so that it is run when we
89 execute 'test.py'. If you open 'test.py' in a text editor, you will see that
90 it is a Python File that makes use of Python's ['unittest',
91 module] (https://docs.python.org/3/library/unittest.html) for unit testing.
92
93 Each class in this file serves as a collection of test cases, and each method
94 within a class represents a particular test case.
95
96 Running 'test.py' will cause Python to run and report on all of the tests in
97 the file. However, you can make Python run only a subset of the tests by
98 running, for example:
99
100 """
101

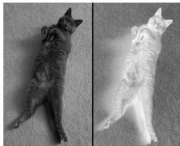

```

3) IMAGE FILTERING VIA PER-PIXEL TRANSFORMATIONS

As our first task in manipulating images, we will look at an inversion filter, which reflects pixels about the middle gray value (0 black becomes 255 white and vice versa). For example, here is a photograph of Adam H's cat. On the left side is the original image, and on the right is an inverted version.

Most of the implementation of the inversion filter has been completed for you (it is invoked by calling the method called 'inverted'), but some pieces have not been implemented correctly. Your task in this part of the lab is to fix the implementation of the inversion filter.

Before you do that, however, let's add a simple test case so that we can test whether our code is working.

Let's start with a 1x4 image that is defined with the following parameters:

- height: 1
- width: 4
- pixels: [12, 76, 154, 222]

If we were to run this image through a working inversion filter, what would the expected output be? In the box below, enter a Python list representing the expected 'pixels' key in the resulting image:

3.1) Adding a Test Case

What Is A Server?

What Is A Server?

Sockets

Sockets allow communication across processes (on the same machine or different machines).

Typically, a *server* will wait for a *client* to make a connection on a designated *port* (a virtual endpoint for a connection).

Once the client connects, the socket allows for communication between the server and the client.

Client and server can each send/receive data via the socket.

Example: yelling echo server.
